SECURACOM GPS LITTLE BROTHER™ INSTALLATION, WIRING COLORS & FUNCTIONALITY

Red: Constant-On 7-30Volt power supply

Black: Ground

Yellow: For future output function

Blue: Input for triggered event i.e. panic button, crash sensor etc. (works with momentary 3 second switch to ground)

Green: Auxiliary power out to trigger relay (remote start, unlock doors, disable starter etc.)

Brown: Not used

To install the unit:

1) Securely attach **Red** wire to constant 12-30 volt power supply

2) Securely attach **Black** wire to good ground

3) Watch indicator lights

a) Far left is power and should be **Green** and flash once per second.

Note: If the light is **Orange**, you have a weak battery and the unit will shut off to preserve the battery. If you have a **Red** light, you do not have a good power supply or the ground wire is not connected properly.

b) Middle light is network connection signal strength. This light should be **Green**. If it is **Orange** it means you have a poor network connection. Try moving the antenna 8 inches. If you get a **Red** light, you have no network connection. Having the GPS and Cell cables in the wrong position normally causes this.

c) The far right light indicates the GPS signal strength and should be **Green**. If it is **Orange** you have a poor signal but the unit will work. If you have a **Red** light, you have no GPS reception. Try moving the antenna 8 inches. CAUTION: Antenna must be facing the sky as the label on the antenna suggests.

4) Go to the web site **www.trackmygps.com** and try a test track. If your unit does not track call for assistance.

If you have any problems or questions call:

Gary Ryan at 313-402-0700 anytime.

About SECURACOM GPS

SECURACOM GPS, **www.trackmygps.com** is a privately-owned and operated manufacturer, sales and marketing company that is a provider of wireless vehicle tracking solutions and other safety related automotive accessories, serving individuals, private, government fleet operations and OEMS.
